

## Design for class “CustomerScreen”

Inheritance of class “BaseScreenHandler”

| CustomerScreen                                                                                           |
|----------------------------------------------------------------------------------------------------------|
| - bController : BaseController                                                                           |
| + setBController(bController : BaseController) : void<br>+ navigateTo(screen : BaseScreenHandler) : void |

**Table 1. Attribute Design**

| # | Name        | Data type      | Default value | Description                                                          |
|---|-------------|----------------|---------------|----------------------------------------------------------------------|
| 1 | bController | BaseController | null          | The controller responsible for handling user actions in this screen. |

**Table 2. Operation Design**

| # | Name                        | Return type | Description / Purpose                                            |
|---|-----------------------------|-------------|------------------------------------------------------------------|
| 1 | setBController(bController) | void        | Assign the controller used by this screen.                       |
| 2 | navigateTo(screen)          | void        | Switch from the current screen to another screen in the UI flow. |

### Method Design:

#### 1. setBController(bController: BaseController)

- Parameter:
  - o bController: BaseController - the controller for this screen.
- Exception:
- Method:
  - o Assign the given controller to this screen instance.

#### 2. navigateTo(screen: BaseScreenHandler)

- Parameter: screen:
  - o BaseScreenHandler - the destination screen.

- Exception:

- Method:

- Hide the current screen.
- Display the destination screen.
- Pass required context if needed.
